Example Wi-Fi Network Report

Project description

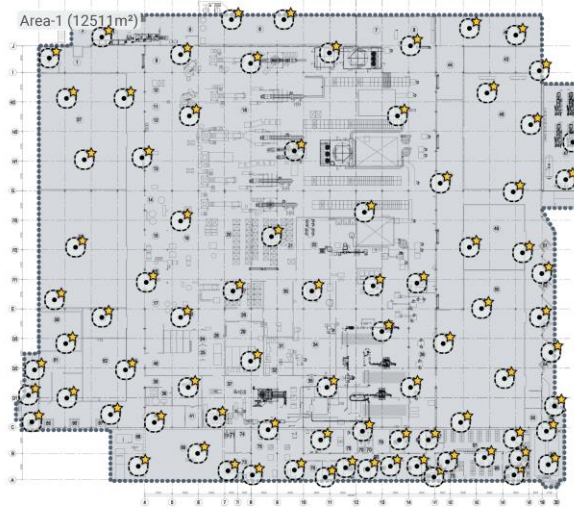

This is an example report, generated by Trusted Networks to show what information can be reported on using our Ekahau software.

If you would like to see any specific data in an example report – let us know and we can make generate a customized example report for you.

More information is available on our website – <https://trustednetworks.co.uk>

Notes		

Signal Strength for Example_Processing_Plant_Site on 2.4 GHz band

Signal Strength - sometimes called coverage - is the most basic requirement for a wireless network. As a general guideline, low signal strength means unreliable connections, and low data throughput.

Signal Strength for Example_Processing_Plant_Site on 5 GHz band

Signal Strength - sometimes called coverage - is the most basic requirement for a wireless network. As a general guideline, low signal strength means unreliable connections, and low data throughput.

Secondary Signal Strength for Example_Processing_Plant_Site on 2.4 GHz band

Secondary Signal Strength shows the second strongest RSSI on any given location on the map. This heatmap helps to ensure smooth roaming for clients and quality of service for certain latency-sensitive applications, such as VoIP calls.

Secondary Signal Strength shows the second strongest RSSI on any given location on the map. This heatmap helps to ensure smooth roaming for clients and quality of service for certain latency-sensitive applications, such as VoIP calls.

Tertiary Signal Strength for Example_Processing_Plant_Site on 2.4 GHz band

Tertiary Signal Strength is used to display the third strongest RSSI on any given point of the map. Tertiary Signal is mostly used to ensure sufficient quality of service for certain specialized services, such as Real-time Location (RTL) applications.

Signal To Noise Ratio (SNR) for Example_Processing_Plant_Site on 2.4 GHz band

Signal-To-Noise Ratio indicates how much the signal strength is stronger than the noise (co-channel interference). Signal must be stronger than noise (SNR greater than zero) for data transfer to be possible. If the signal is only barely stronger than noise, you may encounter occasional connection drop-offs.

Example Wi-Fi Network Report

Channel Interference for Example_Processing_Plant_Site on 2.4 GHz band

Channel interference indicates the number of access points overlapping at each location in a single channel.

Example Wi-Fi Network Report

Channel Interference for Example_Processing_Plant_Site on 5 GHz band

Channel interference indicates the number of access points overlapping at each location in a single channel.

Example Wi-Fi Network Report

Number of APs for Example_Processing_Plant_Site on 2.4 GHz band

Number of Access Points indicates the number of access points audible at each location.

Example Wi-Fi Network Report

Data Rate for Example_Processing_Plant_Site on 2.4 GHz band

Data Rate is the highest possible speed (measured in megabits per second) at which the wireless devices will be transmitting data. Typically the true data throughput is about half of the data rate or less.

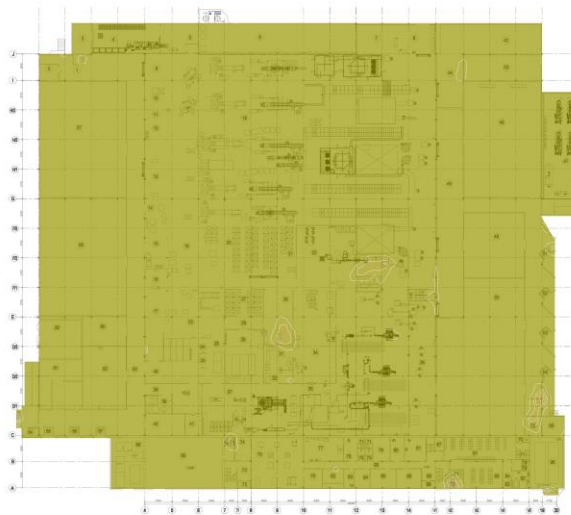

1 Mb/s

300 Mb/s

Network Health for Example_Processing_Plant_Site on 2.4 GHz band

Wi-Fi is typically built for a certain purpose or several purposes, such as VoIP, web browsing, or location tracking. With Network Health, you can, with a single visualization, display whether the network meets your requirements or not.

Network Issues for Example_Processing_Plant_Site on 2.4 GHz band

Network Issues complements Network Health by showing the requirement that is below the threshold level at each location. Whereas Network Health answers the question "Does it work?", Network Issues answers the question "If it doesn't work, why?".
